Support Agent (1).json

Workflow:

Workflow n8n.png

Test cases:

1. I can't access my AI PM course. Executed workflow

2. I want a refund for my AI PM course.

3. I have a billing dispute and need help from your support team.

Learning:

For this assignment, I built an AI-powered learner support agent in n8n to automate common learner support requests. The workflow starts with a manual trigger, uses the Gemini LLM to classify incoming queries into Course Access, Refund, or Escalation, retrieves learner information from Google Sheets, generates an appropriate response, logs the request in a Google Sheet, and routes complex cases to a human support path.

While building the workflow, I faced several challenges. The biggest issue was configuring the Gemini API, as I encountered service availability and rate limit errors before the connection started working correctly. I also spent time troubleshooting the workflow logic, especially the IF conditions and Google Sheets integration. At one point, duplicate log entries were being created because of an incorrect workflow connection, and I had to carefully trace the execution path to identify and fix the issue. Another learning experience was understanding how data flows between nodes and ensuring that only the intended branch of the workflow executed.

This assignment helped me understand that building an AI agent is much more than simply connecting an LLM. A reliable workflow requires proper decision-making, conditional routing, integration with external systems, and thorough testing. I also learned the importance of validating each node individually before testing the entire workflow.

If I were to improve this solution further, I would replace the mock Google Sheet with a real learner database, dynamically identify learners using their email or user ID, integrate a ticketing system for escalated cases, and connect email notifications so learners automatically receive responses. Overall, this assignment gave me practical hands-on experience in designing, debugging, and deploying an end-to-end AI workflow using n8n.
